## 1. Present situation:

- ▶ airspace congested in Europe
- ▶ costly delays crucial to companies
- ▶ few conflicts to solve for controllers

## 2. Questions needing answers for the future:

- ▶ what will future traffic look like?
- ▶ how will regulations adapt to this future traffic?
- ▶ what economic outcomes can be expected?
- ▶ how to be better prepared?

Simulations with  
conflict resolution

Conclusions and  
Perspectives

Based on a air traffic simulator we:

- ▶ simulate future French traffic up to 2035
- ▶ design different regulation scenarios
- ▶ compute ground-holding costs and ATC costs
- ▶ perform a traffic and cost analysis

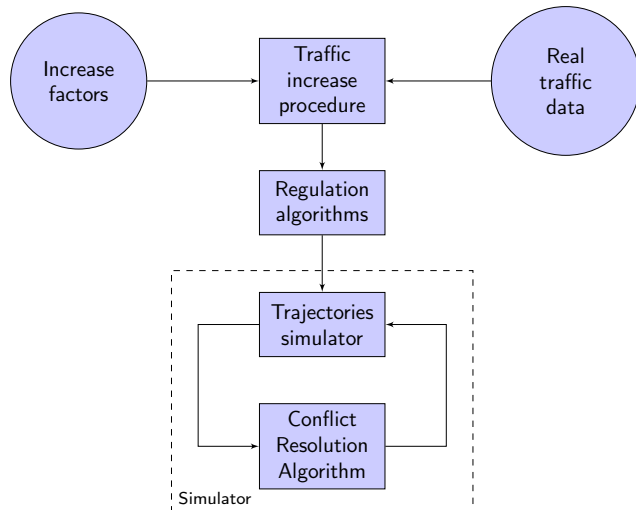

Figure 2: Experimental design

Procedure parametrized by a multiplying factor  $f$  (i.e 40%):

- ▶ go from  $n$  flights to  $n_+ = n(1 + f)$  flights:
  1. choose random flights to be duplicated
  2. apply a small perturbation on departure time
- ▶ same random seed used: consistent increase
- ▶ maintain a similar temporal distribution of flights

## Computer Assisted Slot Allocation (CASA)

- ▶ Allocates slots for take-off
- ▶ Greedy heuristic (FIFO fashion)
- ▶ one delay value for each overflown regulated zone
- ▶ assigned delay: maximum delay over all overflown regulated zones

Conclusions and Perspectives

Data extracted from EUROCONTROL forecasts[2, 1]

Scenario	Annual growth			
	Global Growth	Regulated Growth	Happy Localism	Fragmented World
2012-2019	3.4%	2.3%	2.3%	0.9%
2019-2020	3.7%	2.2%	1.5%	0.6%
2021-2025	2.5%	1.9%	1.5%	0.8%
2026-2030	2.2%	1.5%	1.2%	0.4%
2031-2035	1.9%	1.2%	1.1%	0.7%

Table 1: Summary of flight forecast for Europe until 2035

Year	2014	2017	2020	2025	2030	2035
Increase	+5%	+12%	+20%	+32%	+42%	+50%

Table 2: Traffic predictions with Regulated Growth

Nominal sector capacities for France were used:

- ▶ different from actual regulation
- ▶ remains a valid indicator

Two scenarios of simulations:

- ▶  $S_1$ : the actual regulation is applied with unchanged capacities
- ▶  $S_2$ : no ground regulation is applied

Context and  
Motivations

Conclusions and  
Perspectives

Nominal sector capacities for France were used:

- ▶ different from actual regulation
- ▶ remains a valid indicator

Two scenarios of simulations:

- ▶  $S_1$ : the actual regulation is applied with unchanged capacities
- ▶  $S_2$ : no ground regulation is applied

Extreme situations to challenge both :

- ▶ ground regulation: assigning take-off slots under high demand ( $S_1$ )
- ▶ ATC regulation: conflict resolution with numerous aircraft ( $S_2$ )

# Choice of historical data

Week of French traffic from 2012:

- ▶ high volumes, especially on 6/8
- ▶ consistent differences between computed delays and actual delays

Date	Number of flights	Computed delays (min)	CFMU delays (min)
6/6	8656	1835	4503
6/7	8723	1875	8845
<b>6/8</b>	<b>9053</b>	<b>16086</b>	<b>15505</b>
6/9	8469	5708	13215
6/10	8786	11075	10924
6/11	8817	5507	11449
6/12	8618	4739	8006
Average	8731.7	6689.3	10349.5

# Delay costs

Delay costs need to account for:

- ▶ passenger costs
- ▶ crew costs
- ▶ maintenance costs
- ▶ subsequential delays

## Delay costs

Delay costs need to account for:

- ▶ passenger costs
- ▶ crew costs
- ▶ maintenance costs
- ▶ subsequential delays

Data used: model designed by EUROCONTROL and Westminster University[3]

- ▶ cost function of delay magnitude and type of aircraft involved
- ▶ data stored in tables

Delays (min)	15	60	120	240
B744	1230	20760	120940	213950
A320	410	6800	35280	63530

# Maneuvers costs

Three types of maneuvers issued:

- ▶ speed changes
- ▶ heading changes
- ▶ ascent interruption or descent anticipation

Costs computed as extra fuel cost:

- ▶ define nominal speed with BADA performances
- ▶ compute fuel consumption on original flight plan at nominal speed  $C_{nom}$
- ▶ compute fuel consumption during the maneuver  $C_{man}$
- ▶ the extra cost is the difference  $C_{nom} - C_{man}$

Impact of ground-holding regulation:

- ▶ prevents flight aggregation into peaks  $\leftrightarrow$  eases controller's task
- ▶ smoothes the flow over the day
- ▶ reduces the number of conflicts for heavily loaded sectors

Conclusions and  
Perspectives

(a) Deconfliction costs

(b) Maneuvers per hour - KR sector

Figure 6: Deconfliction costs and maneuvers per hour

1. Regarding ground-holding regulation costs:
  - ▶ grow exponentially with traffic volume
  - ▶ due to larger peak periods, hence larger delays
  - ▶ millions of euros could be saved by removing capacities
2. Regarding ATC deconfliction costs:
  - ▶ remain small compared to ground-holding costs
  - ▶ removing capacities increase resolution costs by 15%
  - ▶ removing capacities dramatically increases workload
  - ▶ conflict situations more and more difficult to solve
3. How to take advantage of this information?
  - ▶ cf. SESAR project [5]
  - ▶ higher degree of automation
  - ▶ design a new regulation

Conclusions and Perspectives

**Conclusions and  
Perspectives**

- ▶ Simulations on future traffic extrapolated from real-life data
  - ▶ increased traffic based on detailed forecasts
  - ▶ insight into future traffic conflict situations
- ▶ Study of interactions between ground-holding regulation and ATC:
  - ▶ Millions of euros can be saved daily by removing sector capacities
  - ▶ Additional ATC effort increases cost by 15%
  - ▶ Controllers' workload increases dramatically
- ▶ Have an insight into future solutions:
  - ▶ design a regulation better adapted to dense traffic
  - ▶ need of highly automated tools to decrease workload

Future work will focus on:

1. follow more detailed forecasts
2. introduce an hybrid scenario  $S_3$ :
  - ▶ determine new capacities
  - ▶ control ground holding regulation costs
  - ▶ control increase in controller's workload
3. perform the same study on direct routes
